

Workflow Feedback

Hey man, I think we need to simplify the whole workflow quite a bit because right now there are too many things going on.

Scripts

In the **script generation** section, we need to be able to **open, review and edit each script before validating it**. Right now, once the scripts are generated, we can't really modify them, and we need to be able to do that.

Generate All

Once the scripts are reviewed and we're happy with them, there should be a **Generate All** button so we can generate all the videos at once instead of having to start them one by one.

Batch Workflow

One important clarification: the workflow should be organized **by batch, not by individual video**.

For example, if we generate **40 scripts**, those 40 scripts should belong to **one batch**, and clicking **Generate All** should generate the **40 videos in that batch** automatically.

The same goes for validation: we should have **Validate All for the entire batch**, rather than having to validate each video one by one.

So the structure should be:

Batch → Scripts → Videos → Clips

If a batch contains 40 scripts, I should be able to open that batch and see the 40 scripts, then the 40 corresponding final videos, with access to the clips inside each video if needed.

Workflow

The workflow should basically be:

Generate scripts → Review/edit scripts → Click Generate All → Videos are automatically generated and assembled → Access the clips only if I need to make changes → Validate All → Send to Airtable

Automation

The prompt generation doesn't need to be visible. That should happen automatically in the background. The same for the clip generation and the editing. I basically want to click Generate All and let the whole process run automatically until I have the final videos.

Final Videos

The videos should already be **fully edited/assembled** when they're ready. The main thing I want to see is the finished video for each script.

Clips

Then for each video, there should be another button to access the **individual clips**, like you showed in the demo. This is only useful if I need to review something, regenerate a specific clip or fix something. After that, I should be able to regenerate the full video with the updated clip.

Navigation / Sidebar

Also, looking at the sidebar, I think we need to simplify the navigation quite a lot.

We **don't need** things like **Experimental, Generation history, or Project clips**. These are making the interface more complicated than it needs to be, so they should be removed from the sidebar.

Scripts Section

We should basically have a dedicated **Scripts** section where we can see all the generated scripts and ideas, see which avatar each script belongs to, open and edit each script, validate them, and then use **Generate All** to generate the videos from the validated scripts.

Videos Section

Then we should have a dedicated **Videos** section where we can see **all the final videos that have been generated and assembled**. Each script should have its corresponding final video here, so everything is easy to find and clearly linked.

For each video, there should be a **View Clips** button to access the individual clips used to create that video. From there, we can check each clip and regenerate a specific clip if something is wrong. After changing a clip, we should be able to regenerate/rebuild the full video.

Structure

Everything should stay clearly linked:

Batch → Script → Final Video → Clips

The sidebar should stay really clean: **Scripts** and **Videos** should be the main content sections. The clips are accessed from each video when needed, rather than having their own separate section.

Project Naming

Also, the project naming needs to be clean and consistent. We shouldn't have **Project 1, Project 2, Project 3....** The project name should simply be:

Avatar Name - Date - Video Number of the Day for that Avatar

For example, if it's the third video generated that day for an avatar, it would be something like **John - 12/09/2026 - 3**. This makes it much easier to identify and organize everything later.

Validate All

Then once I review the final videos and I'm happy with them, there should be a **Validate All** button so I can validate all the videos in the batch at once, and once validated, they should automatically be sent to **Airtable**.

Custom Voices

Also, I noticed that the **custom voice for each avatar hasn't been added yet**. Each avatar should have their own personalized voice, and when generating a video for a specific avatar, it should automatically use the voice assigned to that avatar.

For how to set up a personalized voice for a character, please refer to the Google Doc, **page 2 — “Initial Setup”**:

<https://docs.google.com/document/d/1aluE38lahlvJzXdKw7MW640EE8NUhdFyLNSGU6afT4/edit?usp=sharing>

Speed

And one of the biggest things we need to improve is the **generation speed**. Right now it's way too slow. The whole point of this tool is to save time through automation, so it really shouldn't be slower than someone doing the same process manually. Ideally it should be significantly faster than doing it by hand.

Bottleneck

I don't know if the bottleneck is coming from the web automation, Google Flow or the way the generation process is currently handled, so you'll probably know better what is causing it, but we definitely need to optimize this part.

Overall

Overall, I think the tool should feel much more like a **simple automated production line** rather than having lots of things to manage manually. The user should mainly interact with the scripts, the final videos, and the clips only when something needs to be fixed. Everything else should happen automatically in the background.

Script content

Your body isn't broken.

You've just been eating the wrong foods.

For years, we were told to eat less fat, more carbs, and count calories. But what if everything you've been told is backwards?

In this video, I'll show you 3 simple food changes that completely transformed my energy, focus, and health...

Reel Copy Studio — UI / Workflow Explanation

The five UI screens above translate the workflow feedback into a simpler production flow: **Batch** → **Scripts** → **Final Videos** → **Clips**. The user mainly works with scripts and finished videos; clips and version history appear only when something needs to be fixed.

1. Scripts — Batch list

The Scripts section is the home for every generated script batch. Batches are identified cleanly by date. From here, the user can search batches, open a batch, and access the scripts belonging to it. This keeps the workflow organized around batches rather than individual videos.

2. Scripts — Batch detail

Inside a batch, all scripts can be reviewed and edited before video generation. Each script can be opened, edited, saved, or regenerated. The avatar can still be displayed and used as a filter, while the unnecessary status column and generation-step UI are removed. The batch keeps all scripts together.

3. Videos — Batch list

The Videos section has its own batch list, separate from Scripts. Each row represents a video batch and provides a direct **View videos** action. The user does not need a separate dashboard or a dedicated clips section.

4. Videos — Batch detail

Opening a video batch shows the finished videos generated from the corresponding scripts. The main action is **Edit video**, which opens the editor for that specific final video. The interface avoids unnecessary controls such as status columns, created-date columns, and redundant generation buttons.

5. Video editor

The editor is where detailed corrections happen only when necessary. The final assembled video can be trimmed, clips can be reordered/edited, and individual clips can be regenerated. The right panel shows the **clip text** for the selected clip rather than the entire script. Under it, previously regenerated versions of that clip are available, with **Choose this one** so the user can restore a preferred version.

Version safety

The editor also keeps **Previous versions for this video**. This protects the user when the final video is assembled multiple times: if a newer assembly is worse, an older assembled version can be selected instead of losing the previous result.

Overall workflow

Generate scripts → Review/Edit → Generate All → Automatic video generation & assembly → Edit clips only if needed → Assemble Final Video → Validate All → Send to Airtable.

This matches the original requirement that prompt generation, clip generation, editing, and assembly happen in the background as much as possible, so the interface behaves like a simple automated production line rather than a collection of manual steps.
